

# Drought Monitoring in New Zealand

Brett Mullan, Alan Porteous, Andrew Tait

National Institute of Water & Atmospheric Research Ltd (NIWA), New Zealand

APEC Climate Symposium 2013, Jakarta, Indonesia, November 11-13, 2013

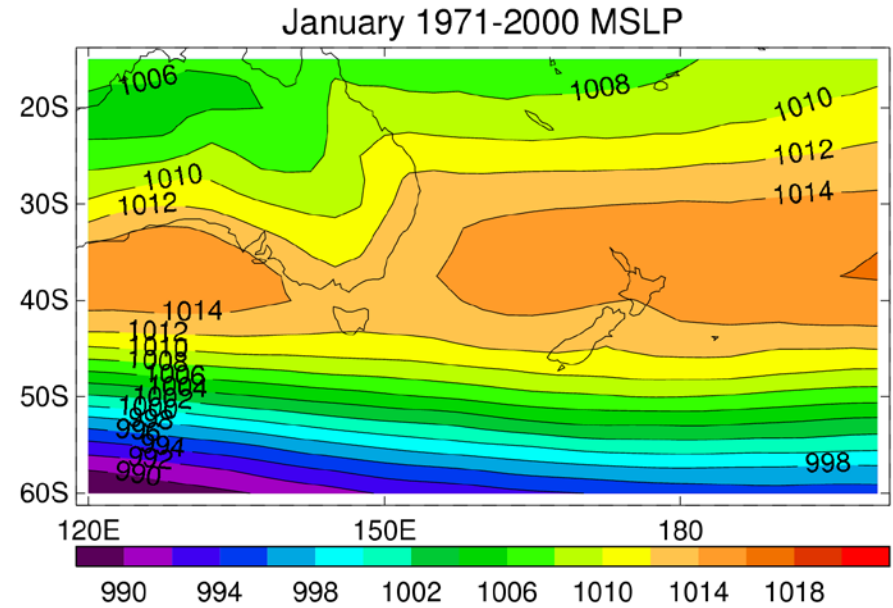

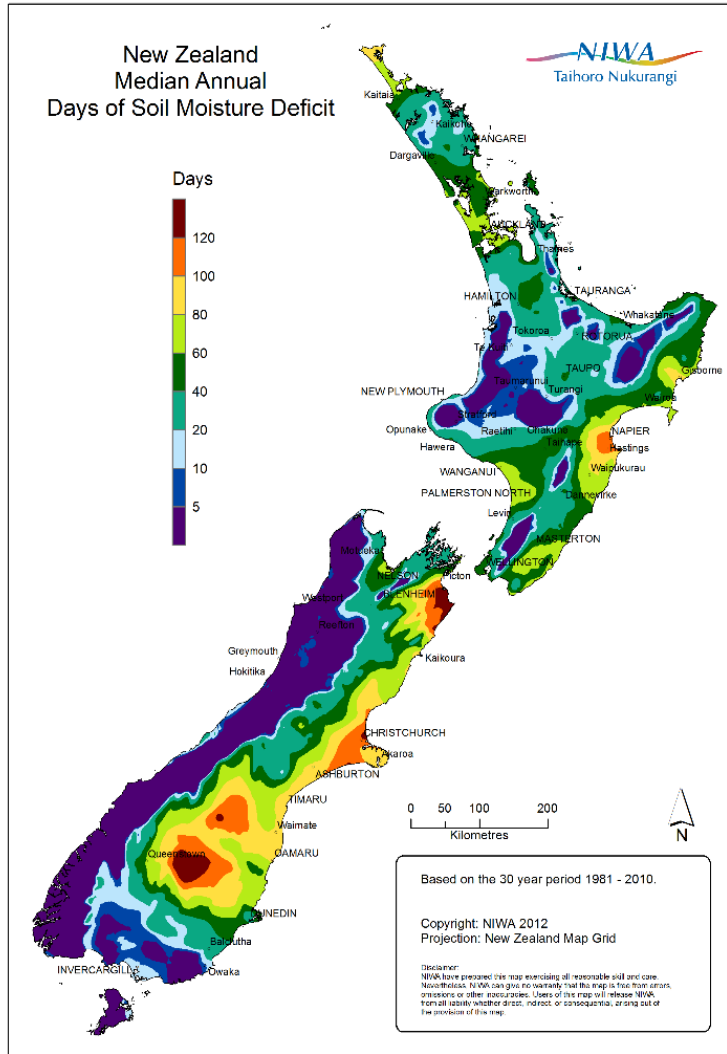

# Outline

---

- Brief primer on NZ climate & drought
- Development of the 2012-13 drought  
& NIWA's role
- Historical assessment of the 2012-13 drought
- Causes of this drought
- Climate change & NZ droughts

# Climatology – SMD & MSLP

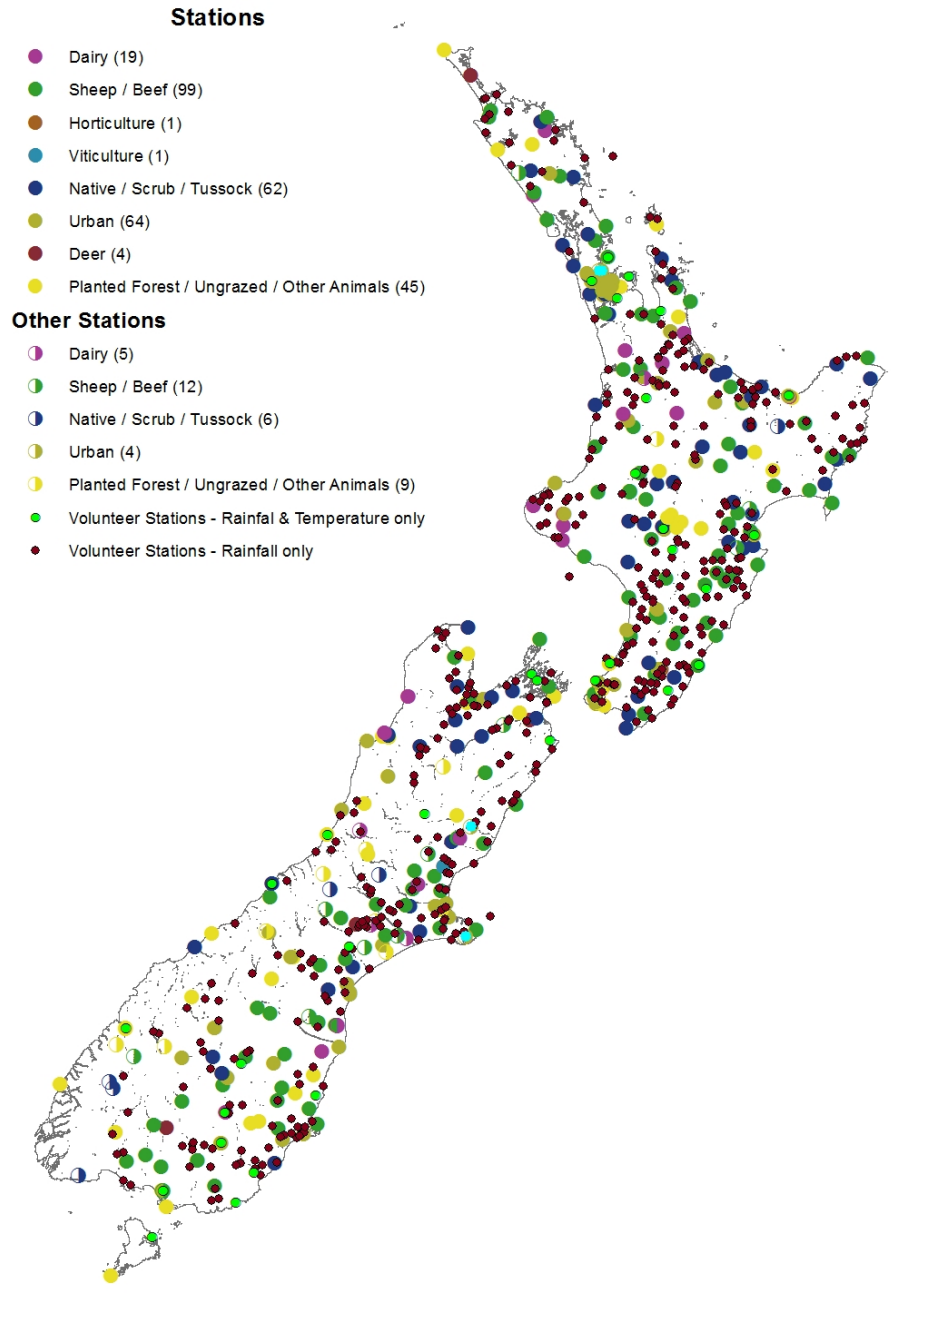

enhanc

# Data network

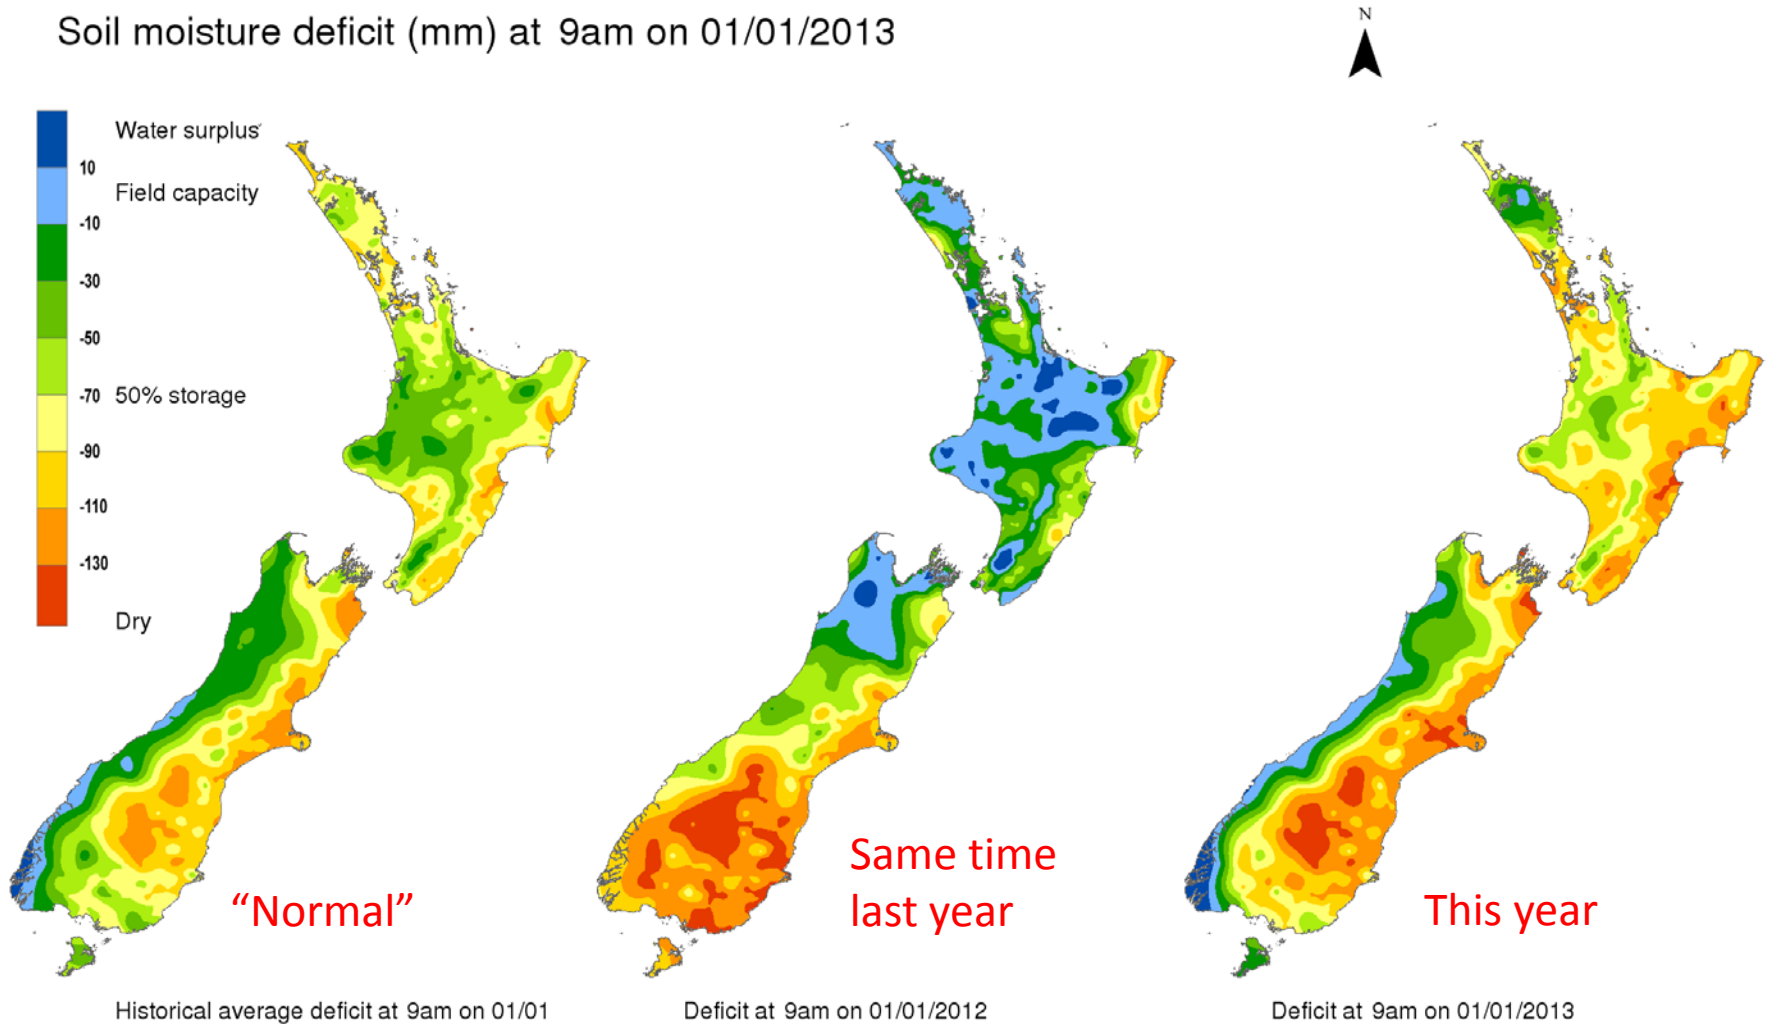

Measured (~300 + rainfall-only)

Interpolated (11,491 total): **VCSN**

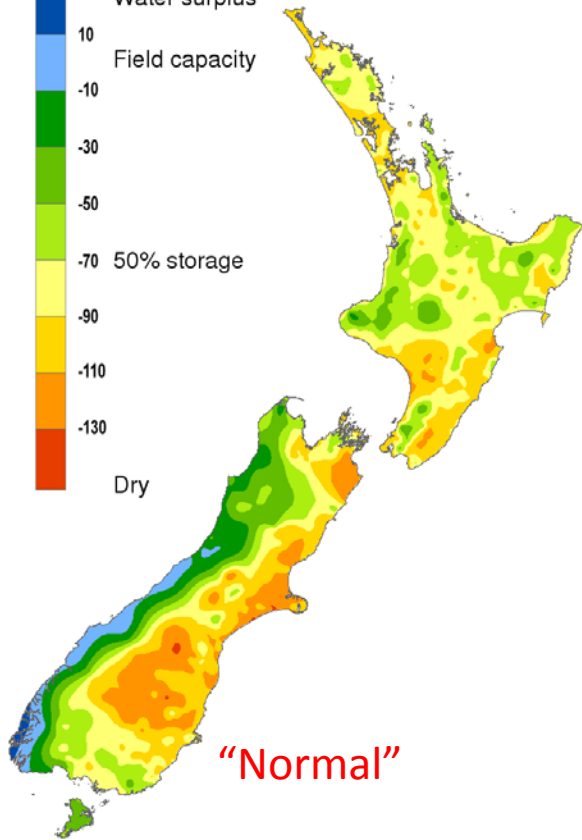

# Beginning of January soil moisture status

Soil moisture deficit (mm) at 9am on 01/01/2013

# Beginning of March soil moisture status

Soil moisture deficit (mm) at 9am on 01/03/2013

“Normal”

Historical average deficit at 9am on 01/03

Same time  
last year

Deficit at 9am on 01/03/2012

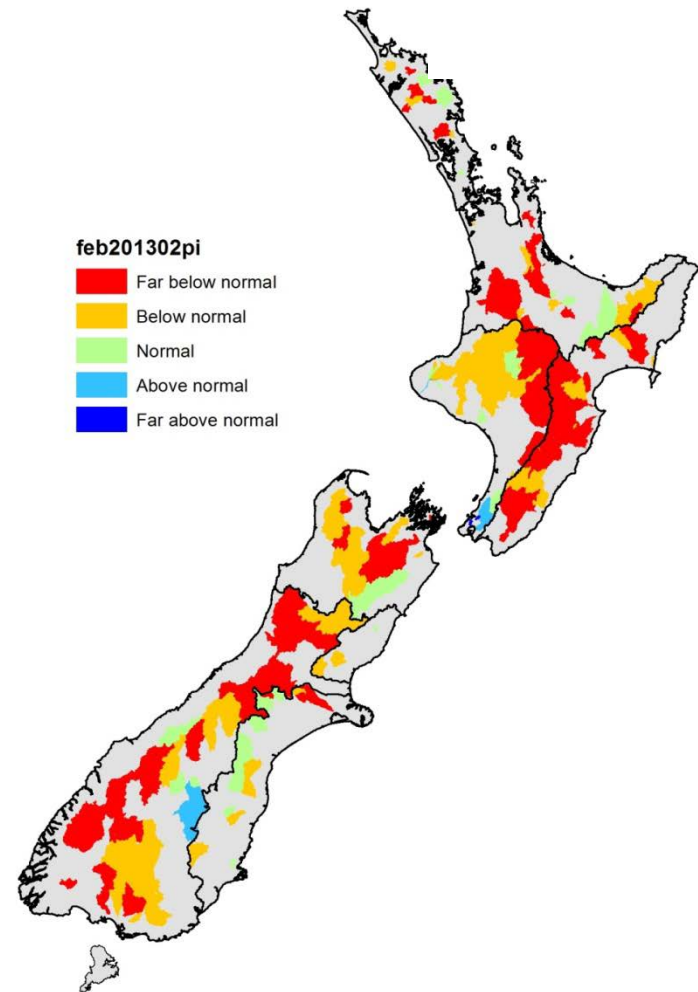

This year

Deficit at 9am on 01/03/2013

# February 2013 river flows

---

- Map shows river flows across New Zealand for February, related to previous Februaries.
- Much of the country has flows that are in the lowest 10% of recorded values for that month (red).
- Nearly all the country has flows in the lowest third (red and orange).
- Data from NIWA, Regional Councils, power companies and NZX.

# Rainfall (% normal) early 2013

Jan

Feb

Mar 1<sup>st</sup> – 17<sup>th</sup>

Anomaly (%)

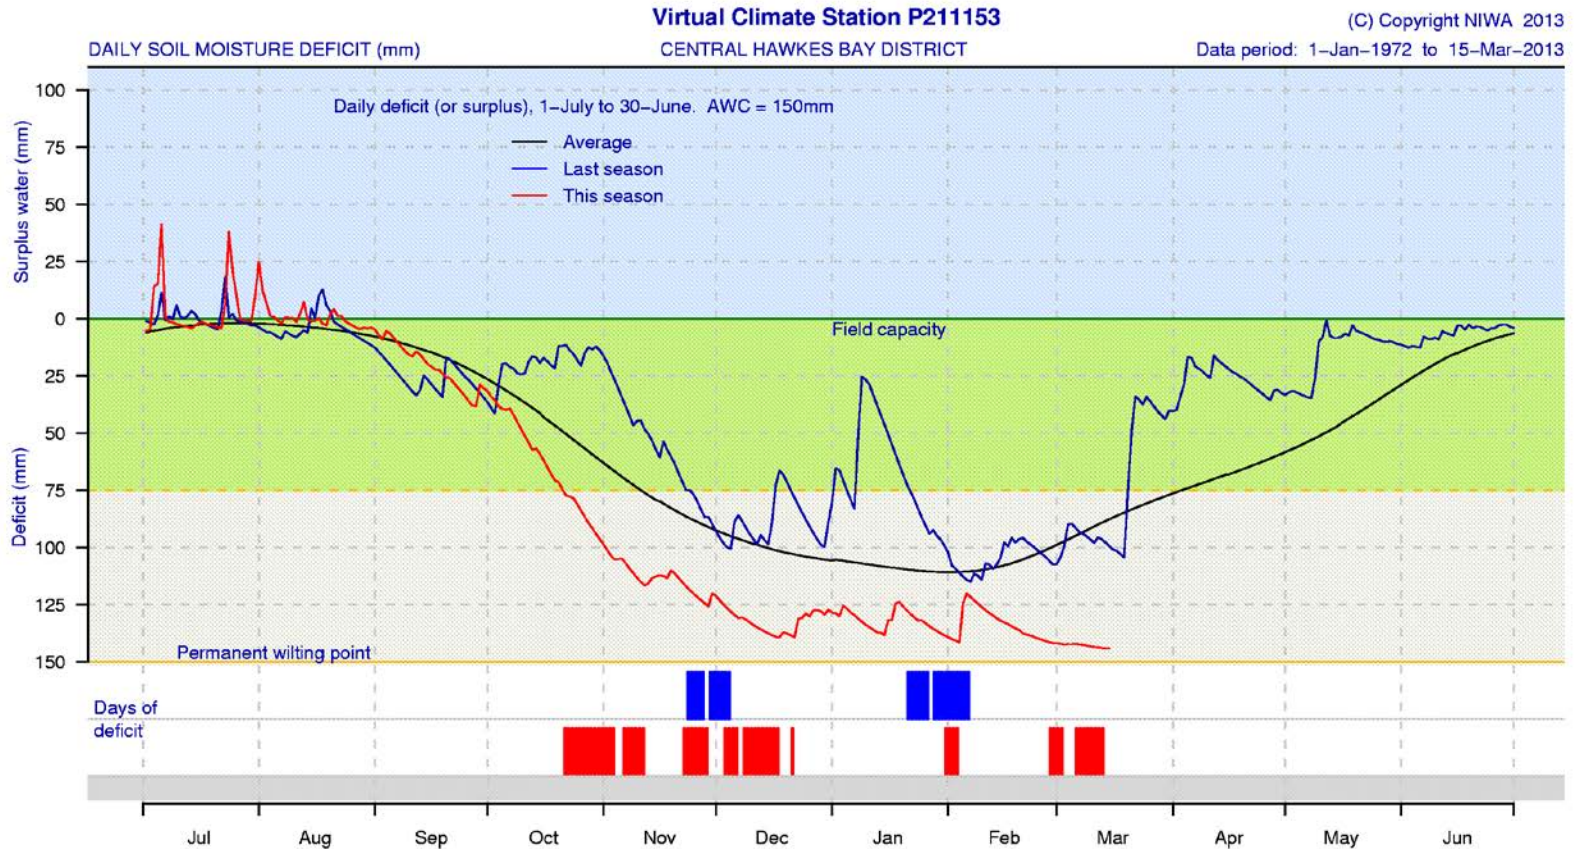

Anomaly (%)

Anomaly (%)

# Mid-March 2013 soil moisture status

# Briefings on drought status

---

- Regular updates (~4 weeks) to MPI (Ministry for Primary Industries) National Adverse Events Committee
- Report to MPI – on extent and historical context of 2012-13 drought

Ministry for Primary Industries  
Manatū Ahu Matua

- Responses to individual enquiries from journalists
- Media Centre of Royal Society of NZ

# Seasonal Outlook before drought developed

## Outlook for November 2012-January 2013

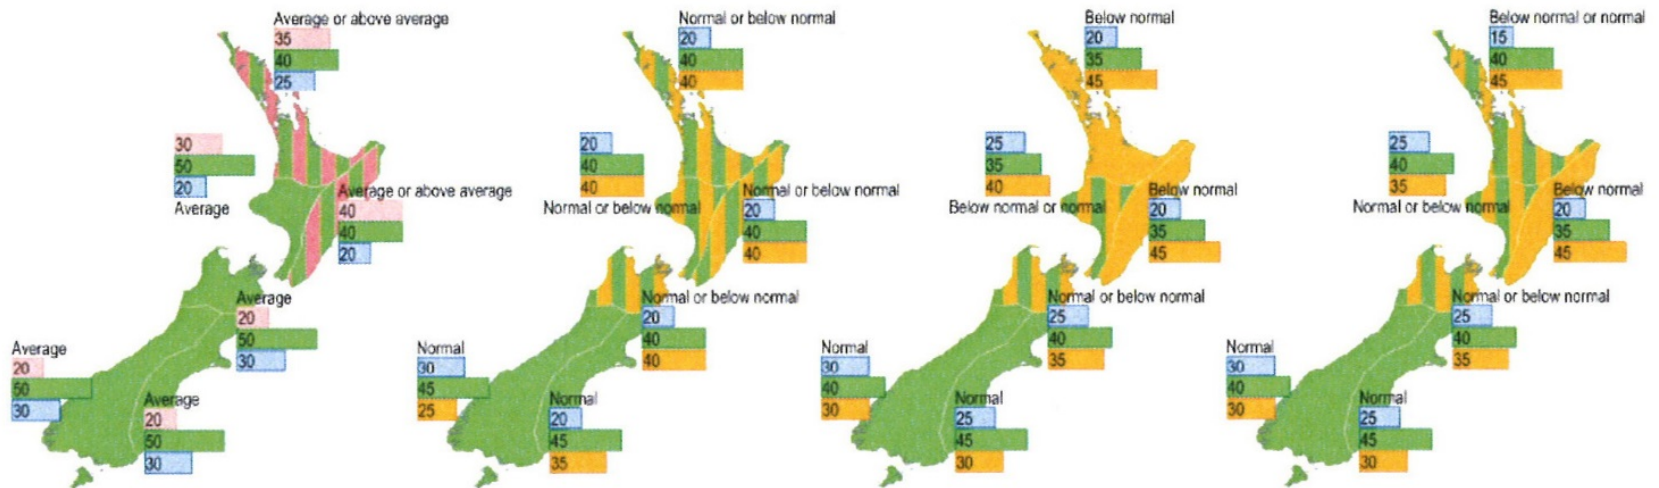

Mean air temperature

Rainfall

Available soil moisture

River flows

Key to maps (example interpretation)

**Below normal**

Upper tercile: 20% chance of above normal 20

Middle tercile: 30% chance of normal 30

Lower tercile: 50% chance of below normal 50

In this example the climate models suggest that below average conditions are likely (50% chance of occurrence), but, given the variable nature of the climate, the chance of normal or above normal conditions is also shown (30% and 20% respectively).

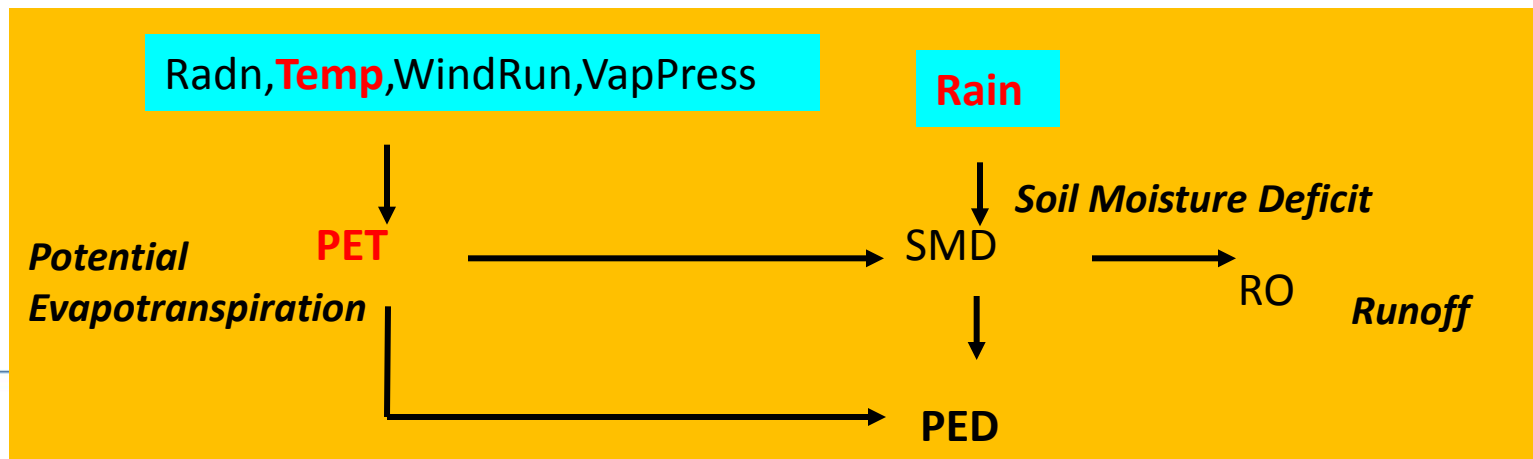

# Drought Index: Potential Evapotranspiration Deficit (PED)

Run a daily soil moisture (S) balance on daily potential evapotranspiration (PET) & precipitation (P), using 0.05° gridded data, 1972-2003

$$S_d = S_{d-1} + P_d - ET_d - RO_d - D_d$$

- Rainfall in excess of field capacity is lost as runoff + drainage (RO+D)
- If  $S_d > \frac{1}{2}(AWC)$  then  $ET_d = PET_d$  (Available Water Capacity, AWC = 150mm)  
If  $S_d < \frac{1}{2}(AWC)$  then  $ET_d = 0$
- Accumulate PED on a daily basis, beginning July 1:  $PED_d = PED_{d-1} + (PET_d - ET_d)$

Accumulated PED is essentially the amount of water that would need to be added to a crop over a year to prevent loss of production due to water shortage

# Water Balance & Spline Interpolation

---

PED calculation applied to:

Climate Database record (sites), or  
5km gridded data

PED Anomaly: Jul 2010-May 2011

PED Anomaly: Jul 2011-May 2012

# 2012-13 Drought – Spatial Extent

Purple shading = Rank 1 = Highest PED

- Dry conditions unusually widespread across North Island, & also affected West Coast of South Island
- Highest PED (in 41 years of VCSN data) much of: southern Northland, Auckland, Waikato, Bay of Plenty, Gisborne, Hawkes Bay, Westland
- Largest July-May PED accumulation in 41 years (VCSN data) over 34% of North Island (purple shading)
- 2<sup>nd</sup> largest PED at 22% of North Island

Rank	North Island	South Island
1	2012-13	1972-73
2	1997-98	1997-98
3	2009-10	1988-89

PED = Accumulated Potential Evapotranspiration Deficit over July-May agricultural year

# 2012-13 Drought – How does it compare?

## Waikato: (West of North Island)

- 2012-13 drought probably worst in over 70 years for Waikato
- Other severe drought years: 1945-46, 1954-55, 2007-08

## Hawke's Bay: (East of North Island)

- 2012-13 drought probably 2<sup>nd</sup> worst in over 70 years for Hawkes Bay
- Other severe drought years: 1945-46, 1957-58\*, 1997-98\* (worst)

PED time series from NIWA CliDB records:  
central Waikato & central Hawke's Bay

# Immediate Cause of 2012-13 drought – high pressures

- High pressure centres unusually persistent in Tasman Sea and over NZ during early months of 2013
- Very low rainfalls; also very sunny and warm

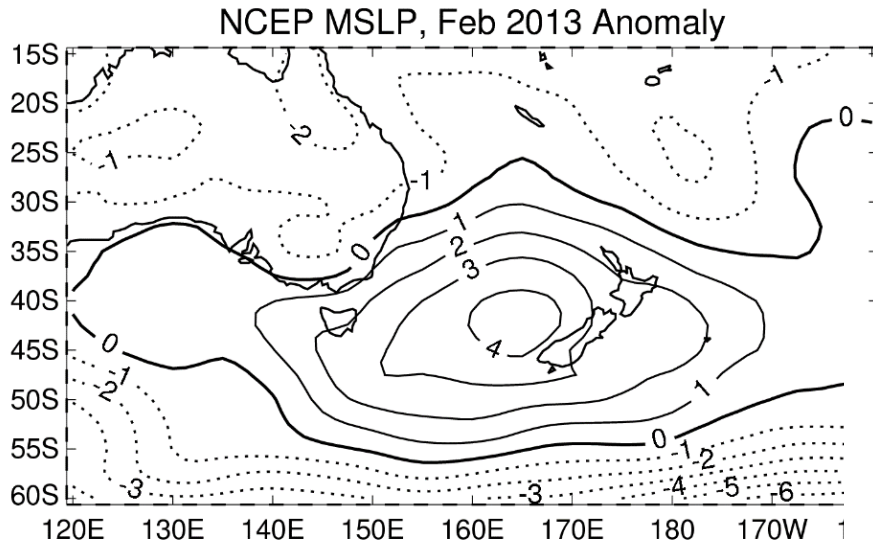

Dec–Feb MSLP: Auckland, Wellington, Christchurch, Hokitika, Chathams, Hobart

- Summer High Pressure Index (averaged over 6 sites: Auckland, Wellington, Hokitika, Christchurch, Chathams, Hobart)
- Index shows very significant increase since 1911/12 summer
- However, high pressures don't always lead to drought conditions; e.g., 1962-63, 1995-96

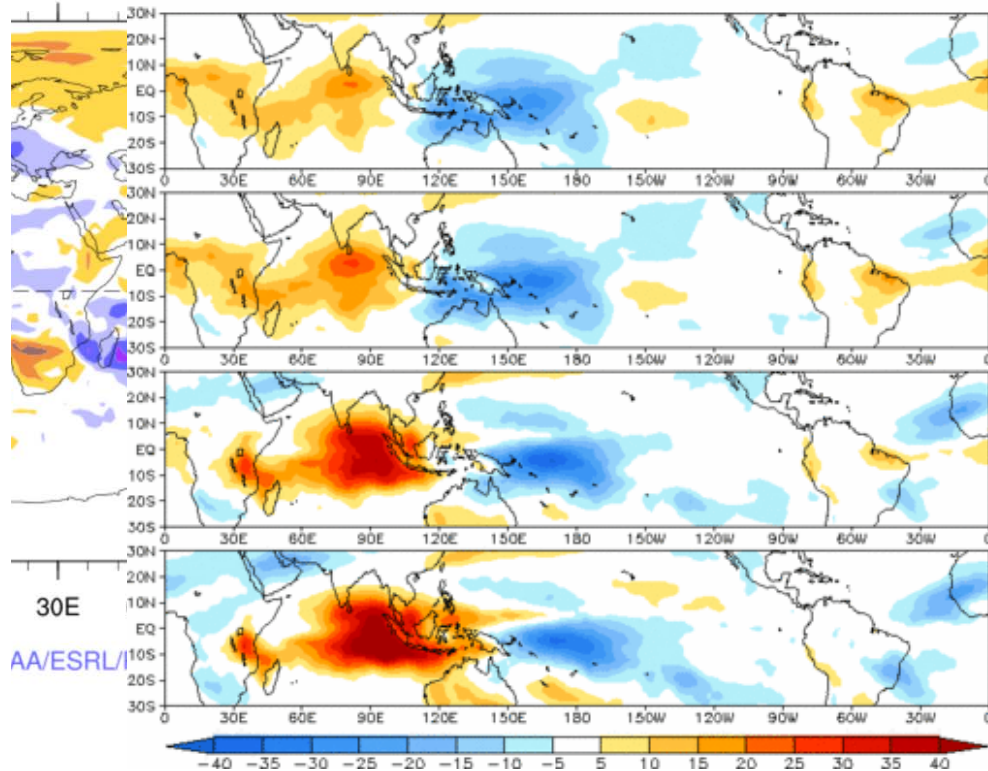

FIG. 8. Covariance maps (OLR homogeneous, V300 heterogeneous) representing the first mode of a two-pentad (10 day) lagged SVDA between pentad-mean OLR anomalies over the tropical Pacific Ocean and V300 over the globe, two pentads later, during SONDJF. The contour interval in the top panel (OLR) is  $2.5 \text{ W m}^{-2}$  and is  $0.5 \text{ m s}^{-1}$  in the bottom panel (V300). In both panels, negative contours are dashed and the zero contour has been omitted. Statistics printed are the squared covariance fraction, temporal correlation between the expansion coefficient time series, and respective explained variance.

# Summary

---

- New Zealand experiences droughts which impact on the economy
- The 2012-13 drought the most widespread on record, costing > \$2 billion
- Monitoring drought development ✓
- Forecasting drought development ?x
- No clear trend in drought severity, in spite of trend towards higher pressures along 40-45S.
